Chapter 1 · Story

Maya arrives late. The room has already decided why.

An original story at the Common Ground repair café.

A fictional story. A real question about people.

What would you do?

Leo is assigning the opening shift. What is his most informative next move?

A Ask Maya about today and check her availability.

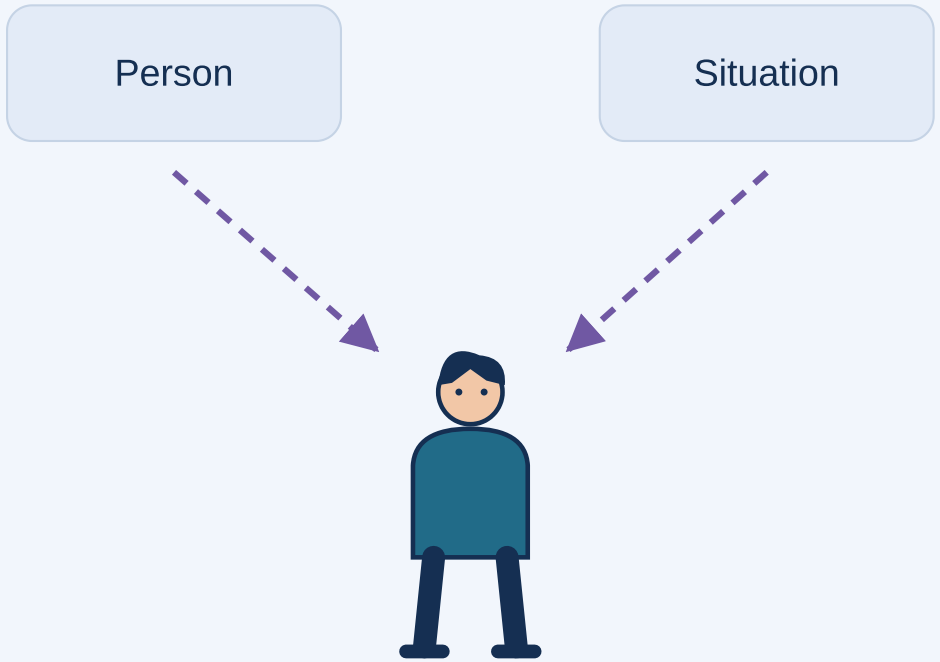

B Use today’s lateness as the main sign of reliability.

C Ignore today and assume she will arrive on time.

Suggested answer: A. Asking Maya about the delay lets Leo investigate the obstacle and plan the shift without ignoring the lateness.

Behavior has more than one author.

- **Person**: tendencies, goals, beliefs, skills
- **Disposition**: a usual tendency, such as patience
- **Situation**: demands, people, available choices
- **Interaction**: pressure can strain usual patience

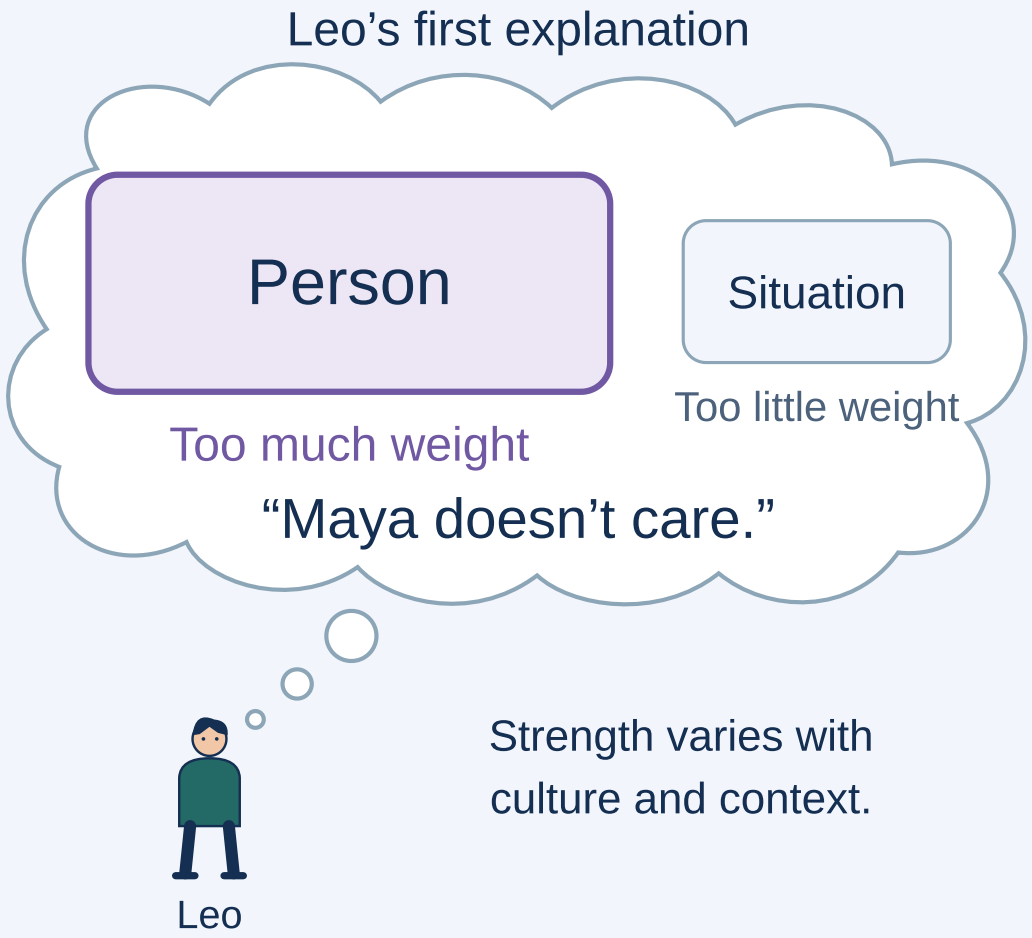

Behavior emerges in context.

Personal qualities and circumstances can both contribute.

Observation is not explanation.

- **Observation**: Maya arrived after the start.
- **Attribution**: Leo explains it as not caring.
- **Fundamental attribution error**: too much weight on the person, too little on the situation.
- **Check**: compare behavior across situations.

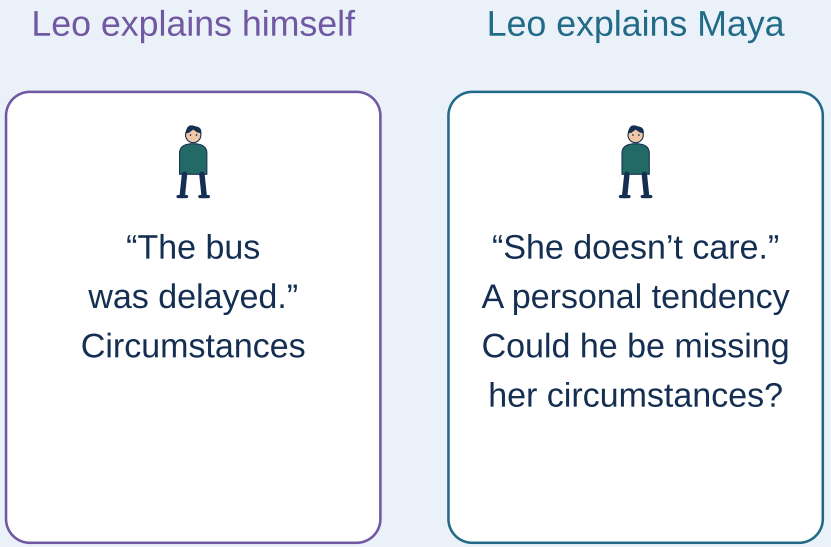

Strength varies with culture and context.

The imbalance is in Leo’s explanation.

What can we really conclude?

An attribution is an explanation of what caused an action. Attribution research describes patterns across judgments. Personal qualities can matter, and repeated behavior across varied settings is more informative than one episode. Actor–observer differences compare how one observer explains their own actions and other people’s actions. In a hypothetical comparison, Leo might cite a bus delay for his own lateness but Maya’s priorities for hers. The pattern varies with the judgment and study design. A separate task is assessing another person’s interpretation. Ask what that person observed, which causes they considered, and what supports their conclusion. Disagreeing with their conclusion does not, by itself, establish that their reasoning is biased.

One observer, two explanations

A possible actor–observer difference.
The pattern depends on judgment and setting.

Hypothetical explanations by the same observer.

Try the idea somewhere new.

A volunteer misses shifts only when the bus service is suspended. What should you test?

A Whether personality alone predicts attendance.

B Whether another travel plan improves attendance.

C Whether the missed shifts can be deleted.

Suggested answer: B. Trying another travel plan tests the suspected barrier while keeping the attendance expectation clear.

Close your notes. Explain it.

> In Maya’s arrival story, what did Leo observe, and what cause did he infer?

> What evidence would strengthen an explanation based on a person’s usual tendencies, rather than one unusual situation?

1. Leo observed that Maya arrived after the meeting had started. He inferred that she did not care about the project. Her late arrival is the observation; not caring is his proposed cause.

2. An explanation based on a personal tendency becomes more credible when the behavior recurs across varied circumstances and plausible alternatives have been examined.

Maya, Sam and Leo at the repair café.

Carry one idea into your week.

Choose a mildly frustrating action by another person. Write what you observed, your initial explanation, two plausible alternatives, and one respectful question that could clarify what happened.

Revisit tomorrow and in a week.
Explain it without notes, then use a different example.

Take the question into a different setting.
